*Acacia baueri* subsp. *aspera* occurrence map.  
Occurrence map generated via Atlas of Living  
Australia (<https://www.ala.org.au>).

#### Family

Fabaceae

#### Distribution

Uncommon in N.S.W. Occurs S of Sydney, Royal Natl Park and near Wilton, and at Wentworth Falls in the Blue Mtns.

#### Description

Branchlets puberulous, tuberculate. Phyllodes in irregular whorls or scattered, rather crowded, with scattered tubercle-based hairs when young. Peduncles 2–4 mm long, usually hidden by the phyllodes. Heads normally 8–10-flowered.

#### Habitat

Occurs in coastal low heath, grows in rocky sandstone areas.

#### Specimens

N.S.W.: Royal Natl Park on the road to Warrumbul, *R.Coveny 4211 et al.* (NSW); 'Little Switzerland', Kings Tableland, *T.Tame 1925* (PERTH).

#### Notes

The low stature, ebracteate peduncle bases and striate pods of *A. baueri* subsp. *aspera* are reminiscent of *A. bynoeana* which differs markedly in its flat, 3-nerved, pungent phyllodes. Sometimes confused with *A. gordonii*.
