Acacia continua occurrence map.
Occurrence map generated via Atlas of Living Australia (<https://www.ala.org.au>).

Common Name

Thorn Wattle, Thorny Wattle

Family

Fabaceae

Distribution

Common in S.A. from Eyre Peninsula and Flinders and Lofty Ranges S to near Adelaide, and scattered localities eastward to near Lake Cargellico, N.S.W.

Description

Openly branching rigid shrub to 2 m high. Branchlets terete, ribbed, glabrous. Phyllodes continuous with branchlets but not forming caulin wings, ascending, straight or ± recurved, often kinked at large gland, ± terete, with lower ones 2–4 cm long, 1.5–2 mm diam. basally and upper ones shorter, tapering to pungent tip, glabrous, with c. 7 distant nerves. Inflorescences simple, 1 or 2 per axil; peduncles 2–6 (–8) mm long, glabrous; basal bracts dark brown and prominent; heads globular, 6–10 mm diam., ± 30-flowered, golden; bracteoles widely spatulate, obtuse, dark brown, evident in buds. Flowers 5-merous; sepals united. Pods linear, constricted between and raised on alternate sides over seeds, curved to once-coiled, to 8 cm long, 3–4 mm wide, coriaceous, glabrous. Seeds longitudinal, elliptic, 3–8 mm long, dull brown; aril lateral, clavate.

Habitat

Grows in hard alkaline, calcareous and sandy alkaline soils, in woodland, open scrub and *Triodia* grassland.

Specimens

S.A.: Micollo Hill, Gawler Ra., *B.J.Conn 1813* (K, MEL, NSW, PERTH, TL); Eyre Peninsula, Mt Gairdner, *N.N.Donner 3355* (AD, PERTH); Port Germein Gorge, Southern Flinders Ra., *D.J.E.Whibley 2031* (AD, PERTH). N.S.W.: Mootwingee Natl Park, *P.E.Conrick 1461* (AD, PERTH).

Notes

The arrangement of inflorescence and peduncular bracts, bracteoles, united sepals and curved to coiled pods suggest this species is nearest the '*A. pravifolia* group', in spite of the form of the phyllodes which in that group are commonly inequilateral, articulate on the stem and flattened.
