Acacia cylindrica occurrence map.  
Occurrence map generated via Atlas of Living  
Australia (<https://www.ala.org.au>).

### Family

Fabaceae

### Distribution

Most collections have been made between Southern Cross and Bullfinch (c. 35 km NW of Southern Cross), but also found NW as far as Kulja (c. 45 km NNW of Koorda), N to Mt Correll (c. 50 km N of Bullfinch) and Bungabbin Hill (c. 50 km N of Koolyanobbing), south-western W.A.

### Description

Spreading shrub 1.5-3 m high. Branchlets apically resin-ribbed, sericeous between the glabrous resinous ribs. Phyllodes erect, straight, terete or quadrangular-terete, (6-) 8-13 cm long, 1-1.2 mm diam., coarsely pungent, rather rigid, minutely sericeous in the shallow longitudinal grooves between nerves, 16-nerved although sometimes only 8 readily visible; nerves closely parallel, slightly raised, subequally prominent, with widest (c. 0.2 mm) on the four slight angles. Inflorescences simple, 1 or 2 per axil; peduncles 0.5-1.5 mm long, densely sericeous; spikes 10-11 mm long, 5 mm diam., densely flowered, golden. Flowers 4-merous; sepals 1/2-3/4-united, sparsely puberulous. Pods linear, flat, slightly raised over and slightly constricted between seeds, straight, to 6.5 cm long, 2-2.5 mm wide, chartaceous, sparsely appressed-puberulous. Seeds longitudinal, oblong-elliptic, 3.5-4 mm long, ±shiny, pale brown; funicle/aril a series of loose loops.

### Habitat

Grows in deep yellow sand or gravelly, well-drained sand, on flat to gently undulating plains or on the sides of low hills, in open shrubland.

### Specimens

W.A.: 10.5 km N of Southern Cross towards Bullfinch, B.R.Maslin 2384 (CANB, K, MEL, NSW, PERTH); 6.4 [miles?] E of Kulja, 17 Dec. 1971, B.H.Smith (PERTH).

### Notes

Erroneously reported by R.S.Cowan & B.R.Maslin, *Nuytsia* 10: 29 (1995), as having 5-merous flowers and as a consequence referred to the '*A. heteroneura* group', but its closest affinities appear to be with *A. filifolia* and its allies. Superficially resembling *A. desertorum* which is distinguished by its globular to obloid, subdensely flowered heads, longer peduncles, narrower, ±quadrangular pods and mottled seeds. There is a superficial resemblance also to *A. sibina* which is most easily distinguished by its branchlets that are glabrous except within phylloide axils, its perfectly terete, sharply pungent phyllodes with more numerous nerves and its wider pods which are clearly constricted between the bicoloured seeds. Also similar to *A. isoneura* subsp. *nimia*.
