Acacia euthyphylla occurrence map.  
Occurrence map generated via Atlas of Living  
Australia (<https://www.ala.org.au>).

### Family

Fabaceae

### Distribution

Restricted occurrence from Truslove (c. 60 km N of Esperance) E to near Clyde Hill (c. 110 km E of Truslove), south-western W.A.

### Description

Dense to mid-dense rounded to funnel-shaped shrub 1–2 m high. Branchlets slightly flexuose, finely ribbed, glabrous. Phyllodes erect, linear, straight to shallowly incurved, 4–9 cm long, 2–3 (–4) mm wide, narrowed towards base, acute to obtuse-mucronulate (mucro sometimes coarsely pungent), slightly thickened, finely longitudinally wrinkled when dry, light green, glabrous; midrib not prominent; gland 1 cm or more above pulvinus. Inflorescences 2-headed racemes; raceme axes 1–2 mm long, glabrous; peduncles 5–8 mm long; heads globular, 4–5 mm diam., 18–21-flowered, golden. Flowers 5-merous; sepals free. Pods (immature) linear, to 6 cm long, 3.5 mm wide, glabrous; marginal nerve narrow. Seeds (immature) longitudinal.

### Habitat

Grows in sand or clay loam, in seasonal swamps or around periphery of salt lakes and marshes, in tall myrtaceous shrubland and mallee woodland.

### Specimens

W.A.: 15 km SW of Mt Ney, 5 km NE of Burdett Road on Mt Ney Road, *M.A.Burgman 1652 & S.McNee* (PERTH); Truslove Reserve, Cox Rd, 1.5 km S of Truslove Rd intersection, 13 km NE of Scaddan, *B.R.Maslin 5805* (G, MEL, NY, PERTH).

### Notes

Similar in appearance to *A. crassiuscula* which has thicker, dark green phyllodes with prominent midribs and the gland nearer the pulvinus, cream-coloured flower-heads in much longer racemes and united sepals; its range is also quite different, as is its preference for granitic situations.
