*Acacia inceana* subsp. *latifolia* occurrence map.  
Occurrence map generated via Atlas of Living  
Australia (<https://www.ala.org.au>).

#### Family

Fabaceae

#### Distribution

Restricted to E of Wubin, W.A.

#### Description

Phyllodes flat, mostly 4–7 cm long, 3–4 (–6) mm wide, at first **appressed-puberulous**, **glabrescent**; tip **curved**, not **pungent** to coarsely **pungent**. Peduncles 3–5 mm long, bearing 15–25-flowered heads. Pods 5–10 cm long, light brown.

#### Habitat

Grows in red-brown sandy loam around margins of saline areas dominated by samphires.

#### Specimens

W.A.: E of Wubin [precise localities withheld for conservation purposes], *B.R.Maslin 4210* (CANB, MEL, PERTH) and *B.R.Maslin 7593* (MEL, PERTH).

#### Notes

This subspecies was described subsequent to the treatment of *A. inceana* by R.S.Cowan & B.R.Maslin, *Fl. Australia* 11B: 80 (2001).

Subspecies *latifolia* differs most readily from subsp. *conformis* by its wider phyllodes. Both subspecies occur in the Kalannie region but are not known to be sympatric and, unlike the typical subspecies, are associated with saline sites. Subspecies *latifolia* often superficially resembles *A. enervia* subsp. *explicita* which also occurs in saline sites in the Kalannie region.
