

# WATTLE

## *Acacias of Australia*

*Acacia incurvaneura* Maslin & J.E.Reid x *Acacia mulganeura* Maslin & J.E.Reid

### Family

Fabaceae

### Distribution

This entity is scattered throughout the Murchison and southern Yalgoo IBRA bioregions and extends to the Gibson Desert bioregion; in some, but not all, populations where it has been collected this entity co-occurred with both putative parents (e.g. N of Wiluna: *B.R. Maslin et al.* BRM 9294 – putative hybrid, *B.R. Maslin et al.* BRM 9292, 9293 – *A. incurvaneura*, *B.R. Maslin et al.* BRM 9295 – *A. mulganeura*).

### Description

This entity has the general facies of a short, broad phyllode form of *A. incurvaneura* except that the phyllodes are narrowly elliptic (linear in *A. incurvaneura*) and the sepals are very short (like *A. mulganeura*). Its salient features are as follows: Youngest phyllodes on new shoots resinous. Phyllodes narrowly elliptic or rarely linear-elliptic, mostly 30–50 mm long and 3–4 mm wide with l: w = 10–22 (*A. incurvaneura* mostly 40–80 × 1–2.5 mm with l: w = 20–80, *A. mulganeura* mostly 20–50 × 5–10 mm with l: w = 3–7). Sepals less than half the length of the petals. Pods 5–10 mm wide.

### Notes

This putative hybrid is described and discussed in Maslin, B.R. & Reid, J.E. (2012). A taxonomic revision of Mulga (*Acacia aneura* and its close relatives: Fabaceae) in Western Australia. *Nuytsia* 22(4): 220.
