Acacia lasiocarpa var. lasiocarpa occurrence map.
Occurrence map generated via Atlas of Living Australia (<https://www.ala.org.au>).

Family

Fabaceae

Distribution

Occurs from Kalbarri S to Mandurah, and also at Bunbury, extending inland to Coorow, W.A.

Description

Shrub 0.3-1.5 m high, compact or open. Spines few or numerous, sometimes absent. Branchlet indumentum variable; hairs **patent**, **antrorse** or **retrorse**, sometimes appressed. **Pinnae** 3-10 mm long; pinnules (3-) 4-6 (-8) pairs, 2-3 mm long, usually **revolute**, **glabrous** or **puberulous** to hirsutellous. Peduncles 6-12 mm long, with **indumentum** as on **branchlets**; heads 5-7 mm diam. (dry), 25-50-flowered; bracteoles **acute** to short-**acuminate**. Pods flat, **glabrous** or **puberulous**. Seed greyish brown, not **mottled**.

Habitat

Common on coastal sand dunes in heath, and inland in sandy gravel in shrubland and woodland.

Specimens

W.A.: c. 33 km E of Geraldton towards Mullewa, *B.R.Maslin* 689 (MEL, NSW, PERTH); Fremantle, *L.Preiss* 898 p.p. (LUND, M, MEL, MO, P, STR, TCD, W); 12 km S of Bindoon on Great Northern Hwy, *M.D.Tindale* 2623 (NSW, PERTH).

Notes

The above description applies to typical var. *lasiocarpa* which extends from Kalbarri S to near Bunbury. On coastal dunes it is a low, compact shrub with axillary spines few or absent; in northern inland areas it is a tall, openly branched shrub with numerous axillary spines. Some specimens from the Cockleshell Gully-Mt Lesueur area are characterised by branchlets conspicuously pubescent-villous, pinnules 5-8 pairs and 3-5 mm long, and bracteoles long-acuminate (e.g. *E.A.Griffin* 2039). Many specimens from N of Geraldton are atypical in having flat or slightly recurved pinnules (e.g. *R.Coveny* 3074, AD n.v., BRI n.v., CANB n.v., MEL n.v., NSW, PERTH); this variant probably warrants formal status, *fide* B.R.Maslin, *Nuytsia* 1: 411 (1975).
