Acacia unifissilis occurrence map.
Occurrence map generated via Atlas of Living
Australia (<https://www.ala.org.au>).

Family

Fabaceae

Distribution

Occurs from Kellerberrin S to Fitzgerald R. Natl Park and near Peak Charles Natl Park, south-western W.A.

Description

Compact shrub 0.15–0.7 m high. Branchlets rigid, puberulous, pruinose between the yellowish ribs. Stipules 1.5–4 mm long. Phyllodes continuous with branchlets and commonly shortly decurrent with them, linear to subulate or narrowly triangular, commonly ± recurved, ± pentagonal when very narrow, 1–3 cm long, 1–3 mm wide, pungent, rigid, green, glabrous, 5-nerved, with the 2-nerved adaxial margin thick and nerve-like; midrib prominent; adaxial nerves sometimes submarginal so phyllodes appear 2-nerved per face. Inflorescences simple; heads sessile, globular or obloid, 8–20-flowered, light golden; bracteoles scariosus, brown, fimbriolate, conspicuous in buds. Sepals united, deeply cleft adaxially, scariosus, brown, fimbriolate; petals 5. Pods constricted between seeds, tightly coiled or twisted, 1–1.5 cm long (unexpanded), crustaceous, dark brown, glabrous. Seeds oblong-elliptic, 3–4 mm long, ridged peripherally; aril oblique.

Habitat

Grows in sand in heath, shrubland or mallee communities.

Specimens

W.A.: near Collgar, c. 10 km SSE of Merredin, A.M.Ashby 1803 (PERTH); 5 km N of Dunn Swamp, c. 80 km NE of Ravensthorpe, J.Taylor 737 et al. (PERTH); 0.8 km E of Newdegate towards Lake King, M.D.Tindale 3761 (A, AD, CANB, K, NSW, PERTH, US).

Notes

The sessile heads, very unusual calyx and tightly coiled or twisted pods readily distinguish the species from taxa with similarly 5-nerved, pungent phyllodes such as *A. baxteri*.
